- - - - - How to clear the localstorage on page refresh What I need to do here is clear the localstorage on page refresh. What I have so far is window.onbeforeunload = function () { localStorage.clear(); } Where should I put this function? A: You can try something like this: var mySetting; if(localStorage.getItem('mySetting')!= "no value"){ mySetting = JSON.parse(localStorage.getItem('mySetting')); } if(mySetting == "value1"){ //do something } //or if(mySetting == "value2"){ //do something } //... localStorage.setItem('mySetting', "no value"); But as ivan-valera pointed out, this approach is very dangerous and never trust anything that came from the client. Instead it is better to use a server side approach such as the sessionStorage, cookies or the webstorage of the browser. You should only use the localStorage when you need to store user credentials or preferences that only matter to the current session, and only persist the data for a limited amount of time. For that reason, it's not recommended to use it as a caching store. Browsers do provide Web storage access with the webStorage property, however this access can be granted only when it is loaded by the user, so it should not be used for storing passwords etc. A: You can do it in a beforeunload, but if you need the value in other parts of your site: Just add var bff6bb2d33

Last week, we *hoped* we'd see

Star Fox 64, the first ever Star Fox game to not be officially licensed, would be getting the same console-based Kinect support it has in the past. However, original producer Yosuke Hayashi has this to say about one of the game's themed new content packs, the Elden Ring, unveiled at E3:

“ We are using the Fox controller to give you new features. You can run and jump on top of enemies.”

No one expects far of Fox for a new motion-controlled first party title, but the fact that the Wii U-skinned Kinect controls are not required is pretty cool.

In a recent announcement, Hayashi confirmed there would be no mini-game DLC.

Q: python ctypes callback function in C# Hi I am using C# to consume a python app (API) I am successfully connecting to the app and calling its methods and so on, The problem is a callback function to pass parameters back I have seen python examples using Ctypes but have not seen how to use them with C#. This is the python code: class MyClass(object): def onConnection(self): self.connection = self.some_lib_handle def onDisconnection(self): pass class ConnectionNotifier(object): def __init__(self, onConnection, onDisconnection): self.onConnection = onConnection self.onDisconnection = onDisconnection self.connected = False self.listener = None def notify(self): print("new connection") if self.listener!= None: self.listener.onConnection(self.onConnection, self.onDisconnection) def process(self): while self.connected: self.notify() How to replicate this in C# A: C# / C# to Python interface / C + dll Here is a tutorial about a way to interface between C# and Python. Method 1 This one is simpler if you just use a reference to Python: public class PythonWrapper : IDisposable { private Process pythonProcess; public PythonWrapper() { pythonProcess = new Process(); pythonProcess.StartInfo.FileName = "python.exe"; pythonProcess.StartInfo.Arguments = "welcome.py"; pythonProcess.Start(); } public void Dispose() {
