Most AutoCAD users create 2D CAD drawings by adding and manipulating shapes and other CAD features. For a drafting or engineering

job, AutoCAD is the software of choice for preparing and editing 2D drawings. For 3D modeling, architectural design, and mechanical design, AutoCAD is often considered too

expensive. However, a variety of third-party software can take advantage of AutoCAD features and can share the license fee. It is a widely used application in the 2D drafting and

CAD market. History
AutoCAD's roots began
in 1976, when Bill
Ashton and Mike
Martin, Autodesk's
founders, wrote the first
version of AutoCAD. In
the early 1980s, they

began selling AutoCAD for use on their own personal computers. In 1982, when Ashton was at the University of Waterloo, he became acquainted with Microfield, a company

based in Cambridge,
Ontario that developed
and sold
microcomputers with on-
board graphics
controllers. He asked
them to license
AutoCAD for use on

these computers. As Microfield's internal focus was on the mini computer market, they needed a desktop version of AutoCAD. Ashton began working on this version, and in

late 1982, released AutoCAD for microcomputer use. The first commercially released version of AutoCAD was for the Apple II. When Ashton and Martin learned that

Autodesk was licensing the application, they decided to become Autodesk's dealers. By this time, Ashton was an associate professor at the University of Waterloo, Martin was a

partner at Arthur
Andersen, and Tom
Alberg was Autodesk's
chief executive officer.
Autodesk was selling
CAD applications for
Macs on a "pay as you
use" basis to schools and

universities. The Macintosh software application was initially launched in 1986 and has since been upgraded several times. AutoCAD was originally available for the Apple II

microcomputer for \$2,900. This was far too expensive for many computer hobbyists, or for students. In an effort to improve AutoCAD for use on personal computers, Autodesk

also offered a
'MicroDOS' version of
the software for Apple
computers. An upgrade
option to the Macintosh
version was added in
1991 and became
available for \$2,999, or

a Macintosh with 9400 Series software for \$3,499. The total cost of the software and software upgrade was \$5,899, a price considered too expensive for many

users. In 1992,
Autodesk released the
first version

LT 2011 adds an interactive timeline to the interface. The timeline is very similar to the one introduced in AutoCAD LT 2009. It allows for better visualization of common

tasks and user interface interactions. The timeline also provides a sortable list of the drawing's blocks and supports customizing the list's appearance.

AutoCAD LT 2011 also

allows for the creation of dynamic block reference tables. A new grid and measurement system was introduced in AutoCAD LT 2011 for specifying horizontal and vertical dimensions.

A new annotation and callout system was introduced in AutoCAD LT 2011 that allows for storing notes and sketches on a drawing. AutoCAD LT 2011 also supports 3D models.

AutoCAD LT 2011 also supports writing and importing tables.

AutoCAD LT 2011 also supports CAD Notes, information describing the models and creation of a drawing's

components and notes.

AutoCAD LT 2011

supports the insertion of images from the local file system. The

Extensible Graphics

Language (XGL) is

introduced as a new

command language for
creation of drawing
styles and basic objects.
The XGL script
language allows for the
customization of the
drawing window. The
Ribbon and Command

Dialog windows are improved. AutoCAD LT 2011 adds a view menu with the ability to cycle between the various layouts. This can be a good replacement for the old floating

views. AutoCAD LT 2011 is available as a cloud-based CAD service. It can be downloaded or updated remotely without a requirement to re-install it on the computer.

AutoCAD LT 2011 also introduces a feature called Auto-Calculate. This feature allows for the creation of objects on the fly without creating them as actual objects. Objects created

using the Auto-
Calculate feature are not
stored and stored
objects are treated as
placeholders. In

While the federal government has yet to propose its own national policy on internet regulation, there is a national legislative effort underway in the

United States, with two bills currently before Congress, one to reauthorize portions of the Telecommunications Act of 1996 (the Telecom Act), and another to create a

consumer broadband
privacy ruleset. The
latter, a pair of bills, one
called the Consumer
Broadband Privacy
Protection Act of 2015
(HB-4033/SB-5279),
the other the Consumer

Broadband Data
Security Act of 2015
(HB-4035/SB-5279) and
introduced earlier this
month by Reps. Bob
Latta (R-OH) and
Thomas Massie (R-KY),
seeks to establish

consumer privacy
protection for
broadband. The draft
text is somewhat vague
about the proposed
rules, but as the bills
propose merely
establishing a

“comprehensive national set of consumer privacy protections for broadband service providers,” they likely would merely add a layer of protection from providers that currently

doesn't exist. One of the more interesting things the bills do is limit consumer information disclosures to companies with more than \$10 million in annual revenue, if they

wish to make such disclosures at all. “I believe the need for a comprehensive national set of consumer privacy protections for broadband service providers is urgent,”

Latta said in a statement announcing the bills' introduction earlier this month. "Today, for example, most broadband providers can share information with third parties, but there

are no consumer
protections in place to
protect against harmful
practices. This is
unacceptable.” “We’ve
seen repeatedly how big
data companies or even
law enforcement

agencies can abuse the technology to invade the privacy of Americans,” said Massie. “I believe that it’s long past time for Congress to step in and set a comprehensive set of national standards

to keep consumers safe online.” The Telecom Act of 1996 allows broadband providers to exchange information between each other, but only with certain requirements of the

telecommunications act.
Among the
requirements: it has to
be “in the public
interest”, but does not
require the provider to
disclose the
information, and may do

so only to government agencies. In many ways,
