At the heart of AutoCAD is the drawing area where the user can enter and save drafts and drawings. The drawing area is split into a number of views that can be changed at any time to reveal additional drafting views, detailed construction views, model views, and page views. Drafts and drawings can be viewed and annotated in any view that has been opened, and the view in which a drawing or document resides can be set at any time to any of the available views. An important feature of AutoCAD is the wireframe modeling. This allows the user to create shapes and edit objects that are defined by geometrical entities instead of just individual points. In addition to the drawing area, the software's interface provides a set of tools and dialogs for configuring the user interface (UI) and creating documents, as well as a coordinate system that can be extended using a variety of coordinate reference systems, including wireframe modeling. In March 2006 Autodesk introduced an AutoCAD LT software product, which is free of charge, and also produces vector drawings, animations, and other specialty documents. In April 2007 Autodesk announced Autodesk Architectural Desktop, which had been in development since 2002. Autodesk Architectural Desktop was initially aimed at the architectural, engineering and construction (AEC) market and was formally unveiled in March 2008 at the 2008 AIA Annual Conference in New York. In July 2011 Autodesk announced Autodesk Revit Architecture, which offers a combined suite of products for the AEC market. Revit Architecture enables designers, architects, and engineers to collaborate, visualize, and document their design work in an integrated 3D model that enables users to collaborate with one another and turn their 2D drawings into 3D visualizations with the use of 3D printing tools. Autodesk Revit Architecture was replaced in 2016 with Autodesk Revit Structure. Early on in its development, Autodesk introduced the full-featured application for hobbyists, AutoCAD LT, first released in March 2006. AutoCAD LT provided a simpler interface than the main, professional version of AutoCAD. In 2017, Autodesk announced the closure of the "Autodesk" brand and the introduction of "AutoCAD" as the sole brand for AutoCAD and AutoCAD LT. The two applications are maintained as separate products that can be purchased through the same website.

Cutty Sark In 1988, the idea of a Christmas or New Year's project occurred to Mr. Stephen Robinson, an artist from St. Petersburg, Florida. Together with his wife, Alana, he decided to create a little ship for their home. They had seen pictures in the Internet of a model for a ship in Porthcurno, Cornwall, and Robinson decided to try to build a wooden model. The Robinson's found a supplier of plywood in Scotland and the company was able to provide them with the material. Within a week, the model was completed and one could imagine it had been built in the United States a century earlier. The ship was made with plywood, the canvas was stained and then glued with beeswax. She was placed in a huge water container in the front of the Robinson's house. The Robinson's were also able to find the old plans for the ship. She was built to look like the famous Cutty Sark, an English sailing ship built in the 19th century. The plans for the Cutty Sark were kept in a special collection and the Robinson's found that they belonged to a famous shipbuilder. For this project, the Robinson's needed the help of other people. They asked friends and relatives to join them for the final stages of the project. The pictures you can see are from the period when the ship was finished. Unfortunately, the ship was in a shipping container during the entire project and it was only when the ship was finished that she was set free. You can see a short film about the project at this link. Stephen Robinson built the Cutty Sark in 1987, during a period when he was a landscape artist, but he began building his first model ship when he was 20. He started with the plans for the Cutty Sark, which were from 1843. In 1988, he was already a landscape artist and his job took him to St. Petersburg, Florida, where he met a local company that sold plywood. He bought the largest roll of plywood that they could sell him and came back with it to his home in Gulfport. With the help of other people, Robinson made his first ship out of plywood. He worked in his home and used plywood as the ship was built around his car. It took only one week to make his first ship. He made the plans with his wife and she also helped him for the final
