How to Use Photoshop There are very few steps to using Photoshop. Click "File" to open your existing image for editing. When the new dialog box appears, select "File" > "Save As." This will bring up a blank image window with a blank line and text field where you can enter a new filename for your image. If you want the image to be smaller, you can select "File" > "Resize" > "Image Size" > and then select the size of the image to be converted. If you want it to be larger, you can enter your desired height and width and use "Fit Image" to maintain the aspect ratio and create a larger image. You can apply the same resizing and cropping parameters to a series of images, and Photoshop will automatically concatenate them into one image. The most common steps to editing are to load up the Eraser tool and use it to erase certain areas of your image. The Eraser tool is the most basic tool in Photoshop. You can erode an area to reveal the background or erase an area of the image to reveal part of another image. You can also use the Clone Stamp tool to erase areas of your image, replacing them with areas from a duplicate of the image. The Clone Stamp tool is also very important because it allows you to create layers in your image and move and edit them. Because Photoshop is a layer-based program, each area of your image can be added to and moved on top of any other area with the other pieces still visible. In many cases, it is easier to erase an area in your image than to use other tools. The Eraser tool is built right into Photoshop and remains in the toolbox. There are a variety of tools that you can use for some of the more specialized purposes of Photoshop. There is a Spot Healing Brush tool that is used to fix small areas of light and shadow. You can use the Spot Healing Brush tool to touch up areas of your image. The Spot Healing Brush tool can only be used on one area at a time, but it can be a quick way to fix minor problems. There is also a Gradient tool that allows you to create gradients in your image and merge the colors of different colors of the gradient together to create a more natural looking transition. There is a Gradient tool that enables you to apply any color or shade of color to the image, one at a time, and merge it with any other area of the image, so

The work piece can include excavating equipment such as backhoes, front end loaders and the like. Such equipment includes the vehicle's lift, boom, linkage and arm, with power at least partially transmitted from the vehicle's engine. The articulated arm of a loader is typically pivotally secured to the tractor frame by brackets which raise and lower the loader arm as desired. One technique to produce the lowest possible center of gravity for a heavy work piece is to elevate it. This can be done by suspending it in a floating position at a substantial distance above the vehicle's ground engaging elements such as tracks, wheeled or skid-plate elements, etc. In order to effectively elevate an excavating element it is necessary to have a mechanism for adjusting the elevation of the element. For example, the element may be attached to the boom of the excavating machine and the boom is typically locked in place by a hydraulic cylinder. The element is therefore held at a certain elevation unless a separate mechanism is provided. Thus the mechanism must move the boom to an elevated position or drop the boom to a lowered position. As shown in U.S. Pat. No. 3,683,709 to Stile, this type of mechanism employs a hydraulic cylinder and is arranged to raise and lower the boom. Such an arrangement requires the operator to raise the boom to an appropriate position and then wait for a certain amount of time before lowering the boom. The time delay provides an opportunity for the operator to observe and/or adjust the weight distribution of the element and the vehicle. It is known to use a rack and pinion arrangement for controlling the elevation of a bucket as shown in U.S. Pat. No. 2,831,725 to J. I. Ryan, Jr., et al. This arrangement is also hydraulically operated. Another type of apparatus for elevating or lowering an element attached to an arm
