For my assignment I have to write a Java program using the native libraries to solve a non-linear system of equations. Currently I can't use most of the Java APIs such as ArrayList/List and I'm not allowed to use any additional libraries. I decided to make use of the StatMath library (statistics package) to be able to solve my equations. However, I'm missing a basic concept how to do this. In the mathematical concept I would normally firstly create a set of equations which are linear and solve them with regard to the unknown/s. Then I could create a

to do this. In the mathematical concept I would normally firstly create a set of equations which are linear and solve them with regard to the unknown/s. Then I could create a second set of equations which are non-linear in the unknowns and use the solutions of the linear equations as an initial value. But how can I do this using the StatMath library? The following pseudo-code represents the idea of how I would solve a system of linear equations:

```
// create a set of equations, // solve for the variables a, b, c // create a second set of equations with x as unknown, // solve for the variables x, y, z CalculateEquations(a, b, c); // solve for the variables x, y, z CalculateEquations(x, y, z);
```

As I said I

a second set of equations with x as unknown, // solve for the variables x, y, z CalculateEquations(a, b, c); // solve for the variables x, y, z CalculateEquations(x, y, z); As I said I can't use the Java APIs like ArrayList/List or anything which provides similar functionality. So any ideas how to deal with non-linear systems of equations? A: The book Algorithm Design Manual might help your understanding. The chapter on numerical methods might give you some good ideas. I would approach the problem as follows: a) Find a way to formulate your system of equations as a matrix equation, since you will then be able to use the libraries for that. b) Decompose the matrix into two positive matrix and a diagonal matrix. That decomposition is similar to what you would do with a LU decomposition. c) Use the LU decomposition to solve the systems of equations.

Here is an article about how to solve systems of equations using LU 6d1f23a050
