the course is designed to prepare students for the one-year introductory computer science course. we expect the python module to be a useful intermediate programming experience before moving to higher-level programming (e.g., c or c++). (formerly numbered 13.) lecture, four hours; discussion, two hours. the objective of the course is to introduce students to the basic concepts of computer science (theory of computation, algorithms, data structures, programming constructs,

programming paradigms and languages, and the structure of computer programs and their execution). p/np grading. this is an introduction to computer science, not a computer science course. the syllabus contains information on courses required to graduate with a degree in computer science. for singleplayer only, this setting pauses the game whenever you open your inventory or talk to an npc. this can be useful, as you can work with your inventory without worrying about being attacked or drowning. however, with autopause on, you can't place items from directly out of inventory (the item must be in the hotbar and selected), nor can you use usable items directly out of inventory. note that independently from this setting it is also in singleplayer only also possible to pause the game by any method which switches out of the terraria program, such the alt-tab hotkey or the windows key function. (formerly numbered 14.) lecture, three hours; discussion, two hours. in-depth introduction to python programming language for students who

have already taken beginning programming course in strongly typed, compiled language (c++, c, or fortran). core python language constructs, applications, text processing, data visualization, interaction with spreadsheets and sql databases, and creation of graphical user interfaces. p/np or letter grading.

Blur Game English Language Pack 133

3a provides students with an introduction to web programming with php. students learn the fundamentals of html for webpages, css for interactive visual elements and using them with javascript. the focus in class is primarily on client-side programming, but also covers server-side programming via cgi (common gateway interface) and scripting with php. the class is excellent for exposing students to powerful programming tools which are used in web development such as javascript , css, and jquery. the class also introduces a knowledge of relational databases such as mysql and postgresql. familiarity with sql is essential in web development. 1a serves as the introductory programming class for the program in computing (pic). all students must have a certificate of completion from the computer programming course numbered 15a or higher in

order to register for this course. students in this course will learn the fundamental aspects of programming necessary to succeed in a variety of different job markets. the class covers the basics of object-oriented programming, data types, algorithms, data structures, input and output, and memory allocation. the class also introduces students to relational databases and the programming language sql. 18a teaches database management systems and structures of relational databases. during the four weeks of the course, students learn introductory topics such as sql, structure of databases, relational algebra, and the structure of databases.

students also learn to retrieve data from a database using sql statements, and learn how to set up database tables and create sql programs to access data in the database. students are encouraged to create database management programs such as a web based information system for a store. the ability to create database management systems is expected. there are good choices of open source tools to use to

implement the student's database, and the software is all free. the ability to set up and manipulate databases is a skill that can be used for many different applications including job and university placements. 5ec8ef588b
