The cloud storage I use is Dropbox, a simple way to save files securely and reassign them quickly. If you use different apps, like Photoshop Mix, they're integrated. I think the app offers a value proposition when combined with Photoshop's powerful application. However, I'm not sure I'd spend any money on this application. It's either that, or make a separate purchase for Elements. But it's available on any operating system, including Mac OS X, the iPad, and Windows. And while the most expensive version is \$400, even the freemium editions offer a lot for free. How about the new Lens Correction feature? It's the kind of feature most of us have long wanted to see: Raw profiles in the lens correction section of the Develop module. You can adjust HSL, Gamma, and Vibrance independently or adjust all three at the same time. Likewise, you can apply a lens profile right from the Lens Correction tool. There are a number of built-in lens profiles in Lightroom, but they are limited to color correction tools. Each adjustment tool has an effect on color, but lens profiles correct things like vignetting, distortion, chromatic aberration, and beyond. In other words, you can correct your lens as an analog to how we make adjustments on the computer. You can use up to five lens profiles at once. Alternatively, you can apply one of the 10 newly added Lens Creator lens profiles and adjust the settings manually. Though you once had to download a photo and images to create a lens profile, Adobe has made it easier. You can now simply start a new document, run Lightroom, and select your lens profile. This is way simpler than having to fiddle around with numerous parameters and presets that you aren't sure about.

Adobe owns the market and it was a major disappointment to see it leave other market places. One of the reasons it left them was by failing to keep up with the new Apple, so Adobe should really bring it all back on to the iPad. Adobe should not remove the Mac App Store and introduce its subscription based model (as Lumion does) as that could be the end of Photoshop on Mac. Adobe Photoshop is now the default PhotoShop application on Mac, and a large number of its features are missing in Windows editions. If you're looking for a Windows option, which I would probably advise unless you simply work on a Mac, use Paint Shop Pro X6 instead. With a similar software approach, but a cleaner interface, it's arguably superior in the first place as it's not based on the very dated PhotoShop XP. Over the past few years, we've seen some mind-blowing innovations like machine learning, facial recognition, face detection, and even talk to the cloud with artificial intelligence. This year, the addition of 3D printing lets you create any physical object from your own digital designs. The new Photoshop Features API is now officially supported by Apple's new iOS 11 feature development tools and brings stylus-based drawing abilities right to the device. It's available on Mac, Windows, and even Linux, and it's a web-based publishing platform that I'd recommend to anyone looking for an easy way to create and publish a high-quality site. The world's premier professional-grade desktop photo-editing software is, in fact, a web-based application that connects to your desktop via Adobe Connect, letting you carry your projects with you.
