The ideas developed in Photoshop are now increasingly being brought to the web by developers to allow designers and developers to create stunning web mobile apps and websites that pushed the boundaries of what's possible. Why not share this new life in the browser with **everyone**? **Why**

Photoshop came to the web

In the early days of the web, web applications were actually run inside a browser on a server instead of through a browser **directly**. In the '90s, this meant using a Server-side language such as PHP or ColdFusion. With time, browsers started to add functionality for things like syntax highlighting and autocomplete to make it possible to develop complex web applications. But when you want to edit high resolution images, there's something much more powerful than code you can write.**How**

Photoshop came to the web

In the late '90s, Kaleidoscope was created by Kevin Lynch. Kaleidoscope used the HTML5 tags (canvas, div, image) along with technologies then cutting edge, like JavaScript and WebSockets. It was a proof-of-concept that a web application could look, feel and function like a desktop application. It was even packaged like a desktop application, with the installer and settings in a separate directory. However, it was all done offline and didn't run without the web server. This was the first time that the web could actually host desktop-like applications. In the early 2000s,

Kaleidoscope was released to the public as a web application in its current form.**WebAssembly porting with Emscripten**

While Kaleidoscope was great in its time, it also had a few downsides, as almost all of its features were made available through JavaScript. The biggest downside was that it relied on a feature called NPAPI, which is no longer available on most browsers. This type of browser plugin is no longer supported on mobile devices, which makes online editing difficult. As browsers started to drop support for NPAPI, Adobe decided to port Photoshop to WebAssembly... with HTML5 added in. 933d7f57e6
