

Portable PIPEPHASE

9.1.12

I'd like to thank the commenter for the kind words.. All i need to do is find out the size of the step size. When i try to save the file, i get an error message "This file cannot be saved... for an unknown reason." which i cannot seem to get rid of even though i have tried many solutions.

A wide variety of implantable medical devices are used for delivering a therapy to or receiving data from the human or veterinary body. Such therapies may include electrical stimulation, drug infusion, defibrillation, and monitoring. A therapeutic device may deliver a therapy or monitor a physiological condition via one or more leads that include electrodes disposed in or on the leads, electrodes on the heart, or an antenna such as in the case of an implantable medical device that collects data from the body. An implantable device may be coupled to the body with a lead. The lead may include one or more elongate conductors that extend from a first or proximal end of the lead to a second or distal end of the lead. A connector at a proximal end of the lead may be used to attach the lead to a piece of implantable medical equipment. Some leads may be configured to allow for an alternate attachment mechanism, such as for example a flocked helical coil that is able to electrically couple to the lead. For example, the flocked helical coil may be arranged at a distal end of the lead and may be coupled to a connector at the proximal end of the lead. In some cases, the lead may include at least one elongate tubular body that contains at least one elongate body section of the lead and one or more electrical conduits. The electrical conduits may be contained within the at least one tubular body. The electrical conduits may be contained within the at least one tubular body of the lead, and one or more electrodes may be disposed along the length of the at least one body section of the lead. For example, the electrical conduits may be insulated from the at least one body section of the lead, and the at least one body section of the lead may be made from a biocompatible material. Leads may be used with implantable medical devices to carry signals from the brain or other tissue under stimulation to electrodes that may be attached to or incorporated within a device housing. Leads may also be used with implantable medical devices to carry signals from sensors or other circuitry incorporated within or attached to a device

Investigation of a novel promising therapeutic agent using a bi-functional gold nanoparticles. It has been demonstrated that substances that modulate the redox status of cells are important for diagnosis and treatment of several diseases, such as cancer

and inflammation. In order to identify a promising therapeutic agent, we have examined the biological activity of a new synthetic agent, 2-methyl-1,4-naphthoquinone (2-M1NQ) using a bi-functional gold nanoparticles (Bio-AuNPs). 2-M1NQ is an organic compound, which was approved by the Food and Drug Administration (FDA) for cancer treatment and

exhibits a significant effect on various intracellular signals. We found that the Bi-AuNPs formulation containing 2-M1NQ showed bi-functional activity: the
