Adobe makes some rather creative use of their Adobe Photoshop & Illustrator CC Simplify feature for more efficient image editing, an easy chore that can be easily done on a Mac or Windows computer. The manual feature-set allows one to re-size, remove dead or unwanted areas, and even beautify photos via a feature dubbed as “virtual retouching”. This is all in Adobe’s most popular image editing software package, and these edits can be done directly on an iPad in a simple and effective manner. Entry-level Android users and those looking to purchase a Basic Scan and Edit iPad will likely find some of these new features reason enough to shell out extra cash for the upgrade. However, there are some features that would be a nice upgrade. Most notably, the ability for documents to be opened from within Lightroom as a document is opened on the iPad. Adobe’s Creative Cloud/Mac application can do this now, and no doubt the iOS version can as well. Over the last year I have been using both Adobe Photoshop CC and the iPad, and at first I was very impressed that it is possible to work with such an extensive file format directly on an iPad, it’s a real game changer. I also believe that Mac users would have some problems with the program since the OS X user interface is very different to the Windows UI, especially with versions that are new. Unfortunately I quickly realized that working on the iPad is not for every project and with my own experience it’s not always possible to work on a project in the right environment.
