Dietary patterns and their association with clinical symptoms of intestinal parasite infections among schoolchildren in Kumasi, Ghana. The study set out to examine the association between dietary patterns and the occurrence of intestinal parasitic infection among schoolchildren in Kumasi, Ghana. The study was carried out in four randomly selected primary schools in the Ashanti Region of Ghana. Three questionnaires were administered to the children by teachers who were assisted by other teachers in the schools. These were the mothers' questionnaire, the children's questionnaire and the teachers' questionnaire. These questionnaires were completed by the children with help from their teachers in their classes. A total of 2025 children aged 5-15 years old participated in the study and were categorized into two age groups namely 5-10 years and 11-15 years. The data were entered into Microsoft Excel and analysed using Statistical Package for Social Sciences software version 12.0 for Windows. The data from the questionnaire showed that the mean prevalence of intestinal parasitic infection was 49.7%. Out of the total 2025 children, 1290 (64.2%) of them showed no signs of parasitic infections. Folate intake of mothers was significantly associated with the occurrence of intestinal parasitic infections in both the age groups. Sufficiently high intake of fruit, particularly green vegetables, was also associated with a low occurrence of parasitic infections in the children. Furthermore, mothers who showed no symptoms of intestinal parasitic infections had a high intake of green vegetables. This study has shown that there is a high prevalence of intestinal parasitic infections in Kumasi. The children showed a high prevalence of worm infestation while the mothers showed a high prevalence of hookworm infestation.

Q: Game Development in 2D: Render to Texture or Canvas I'm developing a 2D game in Javascript and I'm trying to figure out the best way to draw to the screen. The options I have are: Set up my own canvas in Javascript, and just keep it off screen and render my own sprites to it. Use WebGL and use a Canvas2D renderer to render to a WebGL canvas, then take screenshots of the WebGL canvas. Is there a reason to pick one over the other? I don't see much benefit to rendering to a canvas, but the rendering to a texture is rather easy. f988f36e3a
