Smart Previews. Adobe's traditional method of previewing your work is to render a JPEG off of your DNG so they can preview it at higher resolution. In the past, they could change all of their programs back and forth, but now they've gone one step further. Now the save options in Photoshop for iPad offer multiple views to help you exactly determine what that JPEG is going to look like, and how "smart" the previews are. Let me explain. Adobe's AI preview is one of the most expensive things they have for the iPad Pro. The company has spent a good amount of time working on this feature as well as building apps for the iPad that help boost your workflow when it comes to the iPad Pro. You essentially see every single aspect of your final product in live time when you're working in Photoshop, which is something most traditional digital artists have never been able to do. Think about that for a second. You can't preview your work as it will look in a full sized print without first having to download it from your computer and then print it out. You've now managed to make that the most expensive preview image. The way that AI previews work is that you open up the source DNG on the iPad and then go into the Edit menu and Save As... The version you choose is your preview version, and

that's it. You open up your original and the previews display the same exact image. If you have perfected your work somewhere else, the AI preview will hold onto that across the entire project. The important thing to note here is that AI's primary purpose is to speed up development so that you can have multiple assets already laid out before you begin working on them.

In the early versions, the PNG file format supported a great deal of transparency with the GIF and JPEG formats being the ones that didn't support it. Today, there are many websites that sell designs and other items that are based on the stored web pages PNG files. It is the file format for marrying snapshots and animations together. Any bitmap image files—including GIF, JPEG, and TIFF—can be saved in a PNG file format. While DNG is a new standard from the RAW data shot in the camera by the manufacturer, they have now standardized on it for all cameras. If you are using a third-party RAW software, there is a bit of a problem, where you have to find the right settings. You will need to edit

the EXIF data so that any future software can make the best use of it. This is why Photoshop is so important to the industry of design. The latest version, CC, has made it possible to use the camera sensor data and the image stabilization information. This opens up the door to future options. The workflow is easily done and it is very simple to edit Photoshop files. And that is what takes the designer a step ahead of others. There is no need of any special Photoshop software development skills, which is where the work may be getting delay. The Photoshop CC 2017 cost around $700, and the upgrade for Photoshop CS6 can be purchased around $100. Photoshop can edit and create multi-layered images. Images will either be created as layers in the file, or as layers in Photoshop's Layers palette (a.k.a. the Layer Compartment). Layer Compartment is a new document feature for Photoshop CS4 which hosts a collection of Photoshop layers in one spot. When you create a new document (File > New, or Ctrl+N) you select the Layer Compartment. You can then drag any layer in the image's layer palette from one document to another or move them to a new image. This is also where you can use nested layers.
