Adobe Camera Raw is a tool that allows users to work on raw (unprocessed) images and graphics in a way comparable to how photographers typically work on their images. Photoshop includes a RAW (DNG) file format support and a streamlined RAW workflow for novice users and more seasoned Photoshop users. Adobe is an industry leader in RAW photography and editing, and these features will only be further refined with upcoming updates and the new native GPU enhancements. Following the native GPU support for 3D and the new tools in the Photoshop GPU Reference Guide , Photoshop will leverage the GPU to minimize the I/O necessary to create and edit files. In future updates, the native GPGPU support will allow Photoshop to process files the same way the GPU works; not in a two-dimensional manner, but rather as a three dimensional model. The applications of such support include, but are not limited to, using the GPU to process Live-Motion and Sequences. The applications are limitless and will increase as the technology matures. Regardless of the update, Photoshop will continue to be the most powerful image editing tool available. In future updates, when Photoshop can harness native GPU support, it will be able to process the vast majority of files faster and more efficiently, allowing Photoshop to create and edit files with similar speed to using Lightroom. In their native, updated state, the above listed performance enhancements might only be available to users of specific platforms that included native GPU support. Any update to these versions might include GPU and non-GPU related performance improvements, whereas any update to the legacy or new testers updates may only have non-GPU system optimizations. Moving forward, users will be presented with choices to update to the newest or legacy tested release.
