The most common reasons why people choose Lightroom over any other software are its features and ease of operation. Contents like layers, hierarchy, blocks, template and smart collection have made the app easy to use. You don't need to know much about software to use it. The big drawback of this software are the huge file size and the issues with the library after you're done editing. In previous versions of Lightroom, during the editing process, the unorganized library was an obstacle because you had to loop through all the images. I had to manually delete a bunch of photos to make space. The latest version of Lightroom, though, adds a feature that will make everyone's life much easier. The new "Index All Library Items" feature, which is a combination of multiple filters and macros, will help you speed up the editing process. With this feature, all the pictures that you edit or delete instantly get removed. You don't have to manually delete the ones you're done with. Although it allows you to do just about anything with it, Photoshop is better suited to fine art and animation artists, graphic designers, photographers and video editors. It is often considered to be the be-all, end-all of image editing. The editing capabilities of this program are almost limitless and templates and a huge number of plugins are available to enhance your image. Photoshop is a highly versatile tool for designing and retouching. Lightroom is less powerful than Photoshop in the sense that its limitations are obvious and there are far fewer features available to it. Its interface is simpler and the functions are much simpler to use. Lightroom allows you to better control your images (e.g., cropping, exposure, color balance and contrast). Lightroom is less powerful and is not the be-all and end-all of editing. It is more of an all-in-one package than Photoshop.

There's been a lot of chatter about the future direction of digital imaging over the last decade, and, we think, we have seen the start of a new chapter in the evolution of digital imaging in image editing. As such, our product roadmap for 2019 and 2020 is a fully native architecture for Photoshop on macOS. (And for future releases, it will also be supported on Windows with the latest 18.0 version of Windows only.) A native architecture means that features like 3D, layers, and layer groups are all built into an application and are available to all versions of Photoshop, as well as being part of the native OpenGL and Metal graphics APIs. This also means that we can start to do things with more stability. That's great news, especially for users. With that out of the way, I hope you can see that the future of Photoshop looks very exciting. I'd like to think that I'd still be at Photoshop CS5.5 (and would have stopped there!), but if I haven't I'll be there for the launches of the next Photoshop and Photoshop Elements software.
