Q: faster way of converting UserDefaults.standard to array I am trying to store an array of String for user's preferences. I get the data using UserDefaults.standard.stringArray(forKey: "savingsArray") but I want to store this string array of strings into user's preferences. This is how I am storing my data. let savingArray = [UserDefaults.standard.stringArray(forKey: "savingsArray")] UserDefaults.setValue(savingArray, forKey: "savingsArray") This is how I am retrieving the data. if let userArray = UserDefaults.standard.stringArray(forKey: "savingsArray") { print(userArray) } This is how I retrieve the data in swift. if let userArray = UserDefaults.standard.stringArray(forKey: "savingsArray") { print(userArray) } UserDefaults.standard.stringArray() returns an optional A: Assuming you only need/want one value per key, you can use set(value:, forKey:) to store a single value. let userArray = ["one", "two", "three"] UserDefaults.standard.set(userArray, forKey: "userArray") UserDefaults.standard.get(forKey: "userArray") > ["one", "two", "three"] If you need a single value for more than one key, you can use forEach() let userArray = ["one", "two", "three"] UserDefaults.standard.set(userArray.indices.map { userArray[\$0] }) UserDefaults.standard.getAll(keysInArray: ["savingsArray", "creditCard", "userArray"]) > [["one", "two", "three"], ["one", "two", "three"]] A cutaneous lymphoma with poikiloderma. A case of a cutaneous lymphoma with poikiloderma is described. The biopsy specimen was characterized by a low-grade B-cell lymphoma with immunologic aberrations. The patient was diagnosed as having chronic lymphatic leukemia with multiple lymph node infiltrates, complex polycy
