Hand-assisted laparoscopic splenectomy using transumbilical single port technique: is it worth while? For patients with massive splenomegaly, the conventional three-port technique for hand-assisted laparoscopic splenectomy (HALS) is not feasible. The transumbilical single-port technique (TUMP) is a novel approach for splenectomy. The aim of this study was to introduce and assess the feasibility of the TUMP and assess the postoperative complications. From January 2006 to January 2007, hand-assisted laparoscopic splenectomy was performed in six patients using the TUMP. No operation was converted to the open procedure. All the patients received further laparoscopic cholecystectomy simultaneously. All data were prospectively collected and analyzed. The operation time of the TUMP was longer than the conventional three-port technique, but the blood loss and hospital stay were not different. The follow-up result showed no significant difference. The median liver volume was 13 cm<sup>3</sup> and the median spleen volume was 1094 g. The median operative time was 140 minutes. The median postoperative stay was 7 days. The TUMP splenectomy is technically feasible and can be an option for massive splenomegaly splenectomy.

Q: Wrong number of arguments when passing from Kubernetes Service to Pod I am new to Kubernetes and I wrote a kubernetes service on my own, it is working fine. Ask HN: Which is harder for the search engines, programming or writing? - syk I'm currently working on a new project to add wiki-like features to my CMS. In general, does anybody know which is harder for the search engines? I.e. does the search engine have to scan the content of the pages to find out the structure? Or does it scan the content and then find the links to other pages within the content? ===== devmonk You are asking me, as the author of the answer, "am I better off writing in Lisp, C, C++, Ruby or Perl?" I can say I am much more productive in Ruby/Perl than in Lisp. C is like a hitchhiker in the way that you can't easily abstract it. C++ has a learning curve of sorts. ----- \_delirium I'd say: \* basic writing \* organizing and structuring a system \* quality assurance (possibly better for you to have an outside QA person?) \* writing clean, clear code (maybe not so much for you) \* clean, clear documentation That's by order of difficulty, basically. Writing the content is, for the most part, easy, and similar to writing in other languages. The \_hardest\_ part is making sure it's organized well enough that a web crawler can find it. of the MV was unable to perform the surgery due to problems with making the anaesthesia. The next day, they began to make preparations for the operation. After the anaesthesia, the patient suffered arrhythmia while cardiac monitoring showed electrical activity, so the anaesthesia was interrupted. At approximately 09:00 the next morning, cardiac arrest occurred. The patient was intubated and the endotracheal tube was connected to a positive pressure ventilator to maintain adequate respiratory pressure. Rapid-sequence intubation was performed, and 3.5 mg of atropine, a bolus of 500 mg of fentanyl and 50 mg of rocuronium were administered. It was known that the total or partial paralysis of the respiratory muscles is generally attributed to the loss of the vent
