Methotrexate in inflammatory bowel disease. Methotrexate has been employed for the treatment of inflammatory bowel disease since 1971, when it was first used as a therapeutic agent in Crohn's disease and subsequently in ulcerative colitis. In Crohn's disease, the only medication that has been proven effective is administration of a combination of corticosteroids and methotrexate. From a clinical point of view, however, methotrexate can be expected to be less useful in the management of ulcerative colitis than in Crohn's disease. Its most useful role lies probably in treating fistulising Crohn's disease; at present, however, no good clinical trials have been carried out to test this. Methotrexate is not generally effective in cyclic gastrointestinal disease and patients with rheumatoid arthritis, but it does have some utility in other forms of IBD. Quantitative measurement of a new bioluminescent bacterial strain for the detection of enteric pathogens in food. A new fluorescent-bioluminescent bacterial strain (A16D) was developed using the laurate locus from *Photobacterium luminescens* and a gentamicin resistance gene from *P. aeruginosa*. The bioluminescence frequency of this strain, *P. luminescens*-A16D, is up to  $1.3 \times 10^6$  bioluminescent cells per ml. It can be used to detect *Escherichia coli* O157:H7, *Salmonella*, and other pathogenic bacteria in 0.2 g of food in 1 h at 37 degrees C, and the presence of  $1.0 \times 10^3$  cfu in food is detectable under the same conditions.
