AutoCAD 2016 AutoCAD consists of several individual software components for modeling, simulation, and print production, as well as a variety of other components including a relational database system, the Windows-based program AutoCAD Commander and the AutoCAD 360° family of plugins. In addition to engineering-related applications, AutoCAD is also used for architecture, transportation, engineering

graphics, and home, retail and office design, among others. It is available as a standard edition for home and small business users, as a business edition for professional, enterprise, and large business users, and as a product/subscription edition for professional engineering, architecture, and manufacturing. In 2008, Autodesk introduced Application Program Interface (API) capabilities for users to create programs outside the AutoCAD application, enabling

users to create plugins for AutoCAD. In 2013, Autodesk added API support for JavaScript-based application programming with AutoLISP and its ACE technology. In 2014, Autodesk introduced a plugin architecture called Application Connectivity Extensions (ACE). In 2017, Autodesk introduced Application Interchange Component (AIC) as the successor to ACE, which is a C++-based API for .NET and ObjectARX. Raster graphics support AutoCAD uses raster

graphics (as opposed to vector graphics). This means that 2D drawing, text, and logos are done in bitmap (1-bit or 8-bit) format. Raster graphics are not stored in vector format, but are converted from pixel data into one or more vector graphics format. This is used in the diagram editing function where a small geometric model is drawn, and all the elements that make up the diagram are painted as either vectors or bitmaps, depending on the needs of the user. For the rendering process, bitmaps

(1-bit and 8-bit) are stored in the raster graphics format in the BMP (Windows), PBM (Unix), PCT (Mac OS), PCD (Mac OS), or PNM (Windows) file format. For the final output, the correct format can be chosen automatically. An image file with the name.dxf is created as the output. The file format is always in the DXF standard. Raster graphics editing is done using the tools found in the "Edit" group of the tool palette, including the "Align" tool and the "Arrange" tool. Raster graphics editing is done in two

ways: 1. Raster only (no vector-based operations available). 2. Raster + vector (everything is in vector). Raster graphics objects are one of the only areas of AutoCAD where the amount of customization is limited. There are a few ways to convert between raster and vector. The best way is to use the "Rasterize" command, which is available in the "Convert" tool of the "Edit" group of the tool palette. There are two types of "Rasterize" tools. One type allows editing with the software's native

raster editing tools, such as the
