Other programs Of course, Photoshop isn't the only program that you can use to create amazing images. In this book, I share some of the other programs that I use regularly for both my personal and commercial image creation work. These programs include Adobe Lightroom and Adobe Camera Raw to manage and capture my images, Adobe Illustrator for graphic design, and Microsoft Windows Paint for quick and easy image editing. You also might want to consider a program like Apple's iPhoto or Apple's Aperture for easy image management and editing in the digital realm. Or, if you're looking to do digital photo montage work, you might want to take a look at a program like PhotoStitch. # Image Editing Quick Start As you read earlier, Photoshop isn't the only digital photo-editing program out there. There are dozens of other programs available for both home and professional use. Some are simpler to use than Photoshop. Others feature a wider array of features and options. The important thing is that you find the one that best suits your needs — the one that will help you create images that are in line with your personal style and your creative vision.

Contemporary engineering plastics, such as polysulfone and polyether ether ketone, and cured cross-linked thermoset resins have properties that are improved with increased temperature exposure. However, these materials are unsuitable for applications requiring exposure to high temperature in excess of about 300° C. for extended periods of time, for example, as in re-entry space vehicles. The chemical stability of these polymers in high temperature environments is due to the formation of cross-links. Chemical degradation to monomers, oligomers, or shorter chains are observed in some cases at elevated temperatures. Therefore, researchers have attempted to modify polymer materials to impart the thermal and chemical stability of cured thermoset resins to engineered polymers. One approach is to modify the chemical structure of the polymer by introducing a composition of carbon containing compounds such as the polycyclic aromatic hydrocarbon resin, polychlorobiphenyl. However, these compounds produce dark color and subsequently unacceptably low yield. Another approach is to incorporate high temperature resistant moieties into the backbone, that is the polymer structure, by blending the polymers with dispersed, cross-linked macro-inorganic particles, an example being a class of silica-filled polymers. However, a drawback of this approach is that the dispersed particles are not easily removed from the final product, require complicated chemical blending processes, and are otherwise prohibitively expensive to produce. For example, a reaction process for producing polysulfone filled with silica is disclosed in U.S. Pat. Nos. 5,344,950 and 5,656,311, which are incorporated herein by reference, which involves a two-step synthesis process. The first step is a polycondensation reaction in which a polysulfone, such as, polyethersulfone, is produced. In the second step, a gelling step, the polysulfone and the silica are combined, an acid is added, and then heat, for example, in the range of about 200° C. to about 350° C., is applied for a period of time sufficient to effect gelation. After the gel is formed, it is strained and the solid material is recovered. However, a disadvantage of this type of synthesis is the two step process. U.S. Pat. No. 4,358,522, incorporated herein by reference, discloses a process for producing polyether sulfone in the presence of low boiling organic liquids. Generally, a diamine and a

Identification of human colonic polyps by functional MR imaging with gadolinium-DTPA. Dynamic MRI with gadolinium-DTPA (Gd-DTPA) was performed in 39 patients with macroscopic or histologically proved colorectal carcinoma and in 20 patients with colonic polyps; in 26 patients, the Gd-DTPA was additionally performed with oral ingestion of a contrast agent. In four patients the Gd-DTPA was performed following colonic infusion of Gd-DTPA solution. A subsequent histological examination was performed in all patients in whom colonic carcinoma was detected. In 17 of the 21 patients with macroscopically or histologically proven colonic polyps a contrast-enhancing lesion was detected, which was morphologically consistent with a polyp. In six of the 10 patients with a previous negative colonoscopic examination the bowel was filled with Gd-DTPA solution during the MRI examination, and in five of those six patients a polyp was also identified. Dynamic MRI with Gd-DTPA can demonstrate polyps during the first part of the examination. However, in addition to the patients with polyps, others are found to have bowel filling, requiring further specific clinical investigation. These results of dynamic Gd-DTPA examination can be used as a reasonable indication for colonoscopy in patients with a potential colorectal cancer. A New Microbial Metabolite (BM14) of the Gram-Negative Bacterium *Pseudomonas aeruginosa*. Bacterial secondary metabolite production is an important avenue for drug discovery because of its potential to lead to the development of anticancer, antiviral, antimicrobial, and antiprotozoal agents. Herein we describe identification of the first peptide secondary metabolite (BM14) from a Gram-negative bacterium, *Pseudomonas aeruginosa*. The chemical structure of BM14 was elucidated by HRMS, IR, UV, and NMR spectroscopy. The structure was confirmed by X-ray crystallography. We have isolated the gene for BM14, which encodes a peptide consisting of 14 amino acids. The methionine (M) of BM14 is encoded by an amber codon (TAG) and thus its production starts at the arginine (R). BM14 contains only four distinct amino acid residues: R, Q, G, and F. BM14 shares an R-G-F consensus
