Jun 30, 2016. lagu-midi-indo-terbaru-2016-midi-lagu-minang.26.[The bacteriology of lower airway infections in children]. In the year 1976 we sent out 652 cultures of sputum from children suspected of lower respiratory tract infection. The results were as follows: (1) The usual bacterial etiologic agents in recurrent purulent bronchitis in children were Streptococcus pneumoniae (22%) and Branhamella catarrhalis (14%). The percentage of etiologic agents other than the above gram-positive cocci and B. catarrhalis were as follows; Haemophilus influenzae (14%), Klebsiella pneumoniae (14%), H. ducreyi (3%), Citrobacter (3%), Moraxella (2%), E. coli (1%), Pseudomonas (1%), Citrobacter/Citrobacter-like (1%), Acinetobacter (1%), and Mycoplasma/Mycoplasma-like (1%). (2) From 397 (59%) out of 652 samples collected, 20 showed predominant growth of H. influenzae (39%) or H. ducreyi (41%) among the etiologic agents. The results of our study suggest that H. influenzae is
