Remove Disk From CD Player. The CD-ROM drive on your computer is a removable disc-drive that is designed to automatically load and eject CDs. A CD-ROM drive reads data from a compact disc and puts it onto your computer's hard drive. This CD-ROM drive is an optical drive; it does not read digital video discs or read anything other than CDs. It is similar to the CD-ROM drive built into a stereo or car radio. The optical drives used today contain an integral disc drive that writes digital information to the disc, while a drive without an integral disc drive can also be used and is inexpensive; it is called a CD-drive. An optical disc is a disc with plastic on one side, and metal on the other, the metal side usually being  $\frac{1}{2}$  inch (13 mm) in diameter. In the far past, disks came in  $\frac{1}{4}$  and  $\frac{1}{2}$  inch diameters. Audio CD disks are also made by various companies, but they are not widely used. Like the CD used in the reproduction phase of audio, digital data is written in pits of varying depth using an optical laser. A CD player reads data from the disk by shining a laser beam through it. CD players use one of three types of laser: a 650-nm or 850-nm red laser, a 780-nm infrared laser, or a 532-nm violet laser. The CD is known as the Read Only Media (ROM) of the Compact Disc Digital Versatile Disc (CD-ROM). The data written on it is also used for recording digital video. However, not all CD-ROMs are as capable as that. A CD-ROM that was not designed for multimedia applications may not work with software that requires the use of the CD-ROM, although a few old drives do allow CDs containing computer software to be played. You must have this component plugged into the motherboard to play audio discs. The control panel on the motherboard is a grey box with a volume and mute controls. These controls are similar to a media player's controls. The control panel is covered with a black rubber flap. With most motherboards, the control panel is on the back of the system and is accessed by lifting the rubber flap. The Control Panel uses a Red wire to connect to the system's power (red wire) and a Yellow wire to connect to ground. The CD-ROM drive is a device that reads and writes information on a disc. It is different from an optical drive, c6a93da74d
